CERTIFICATE

Certified that Assessment Based Activity work entitled “**ONLINE BOOK_STORE PROJECT**”, is a bonafide work carried out by **SYED ZIAULLA HUSSAINI(4VV23CI110)**, **SAQLAIN PASHA(4VV24CI409)**, **MOHAMMED ANAS KHAN (4VV24CI406)**, **MOHAMMED SAMI (4VV24CI407)**, **MITHIL (4VV22CI064)** in partial fulfillment of the requirement for the completion of IV semesters in **AI&ML** of Vidyavardhaka College of Engineering during the year 2024-25. It is certified that all corrections/suggestions indicated for Internal Assessment has been incorporated in the report. The report has been approved as it satisfies the academic requirements with respect to Activity Based Assessment work.

Introduction

The way people buy books has changed significantly in the current digital era. Online platforms are gradually replacing or enhancing traditional bookstores as e-commerce and online services grow in popularity. A web-based tool called the Online Bookstore Management System was created to help with this change by providing a quick and easy way to browse, search, and buy books online.

Using essential functions like viewing book catalogs, managing inventory, placing orders, and managing user roles (admin and customers), this project replicates the essential features of an actual online bookstore. HTML/CSS is used for the frontend, MySQL is used for database administration, and Python (Flask) is used for the backend. The system uses relational database concepts, such as normalization, to guarantee data integrity and seamless operations.

This project not only emphasizes functionality but also showcases practical uses of DBMS principles. It is an exemplary demonstration of how web technologies can be integrated with database systems to produce efficient and robust software solutions for real-world issues.

Abstract

This project aims to develop an Online Bookstore Management System that allows users to browse, search, and purchase books while enabling admins to manage inventory and sales. It utilizes a MySQL relational database to store book, user, and order data. A Flask backend handles routing and logic, and a responsive frontend (HTML/CSS) provides an intuitive interface. The system enforces data integrity through constraints, triggers, and assertions in the database layer.

Objectives

- To build a web-based platform for book browsing and purchasing.
- To manage books, users, and orders efficiently using a relational database.
- To implement features like shopping cart, admin panel, and inventory control.
- To apply DBMS concepts like triggers and assertions in a real-world scenario.

Functionalities Features

➤ For Users:

- Browse book catalog
- Add books to cart
- Place orders

➤ For Admin:

- Add/Edit/Delete books
- Manage orders
- View inventory status

➤ Database Triggers & Assertions:

- **Trigger 1:** Automatically decrease stock when an order is placed.
- **Trigger 2:** Prevent placing an order if stock is insufficient.
- **Assertion 1:** Price must be greater than 0.
- **Assertion 2:** Stock must not be negative

Technologies Used

➤ Frontend (Client-Side)

- **HTML5:** For structuring web pages and content.
- **CSS3:** For styling the application and improving the user interface.
- **Bootstrap:** For responsive design and UI components.
- **Jinja2:** Templating engine used in Flask to render dynamic content.

➤ Backend (Server-Side)

- **Python 3.x:** Core programming language used for developing server-side logic.
- **Flask:** Lightweight Python web framework used to build and route the application.
- **Flask-MySQLdb:** Flask extension for connecting to MySQL using Python.

➤ Database

- **MySQL:** Relational database used for storing user, book, and order data.
- **SQL:** For writing queries, managing schema, and implementing triggers and assertions.

➤ Other Tools

- **VS Code :** Code editors used for development.
- **XAMPP / MySQL Workbench / phpMyAdmin:** Tools used to manage and interact with the MySQL database.

Advantages and Disadvantages

➤ Advantages

- **24/7 Accessibility**
 - Customers can browse and purchase books anytime, providing convenience and flexibility.
 - **Stock Management**
 - Real-time inventory tracking helps avoid overselling and alerts admins when stock is low.
 - **User-Friendly Interface**
 - Simple navigation and clear layout make the system easy to use for both customers and administrators.
 - **Automation of Processes**
 - Automates tasks like order processing, stock deduction, and record updates, reducing manual workload.
 - **Data Integrity**
 - Use of database constraints, assertions, and triggers ensures reliable and consistent data.
 - **Scalability**
 - The system can be extended with additional features like user authentication, payment integration, and reviews.
-

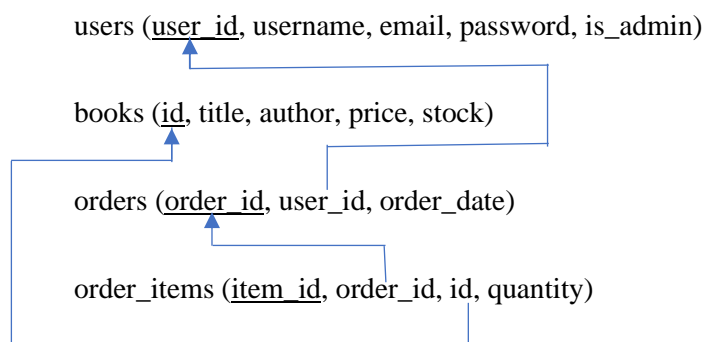

ONLINE BOOK STORE

➤ Disadvantages

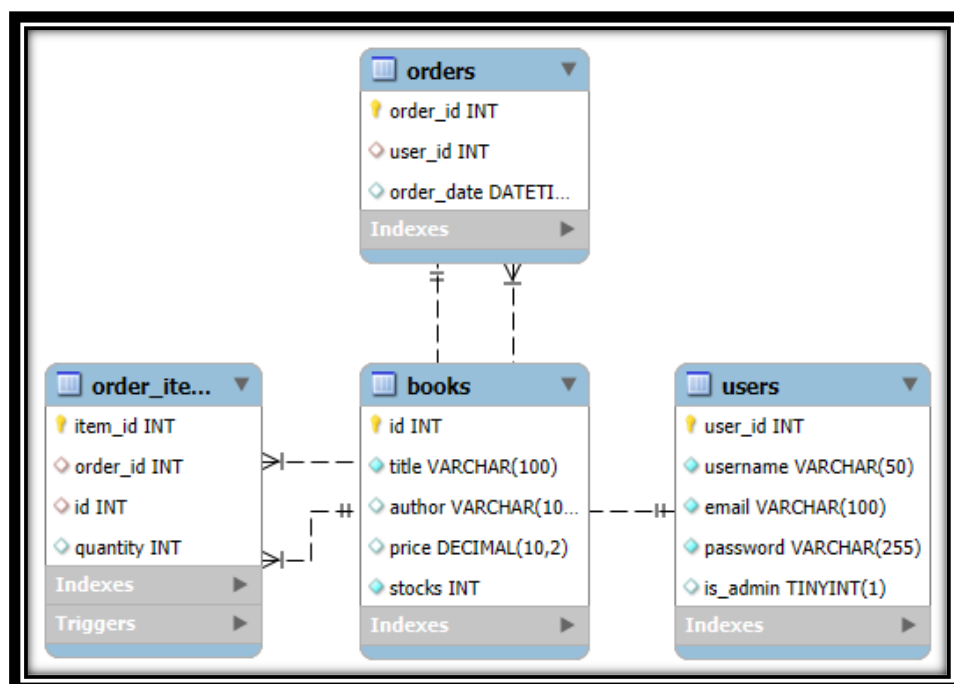

- **Requires Internet Access**
 - Users must have a stable internet connection to access the system, which may be a limitation in remote areas.
- **Security Risks**
 - Without proper implementation, the system can be vulnerable to attacks like SQL injection or unauthorized access.
- **Limited Human Interaction**
 - Lack of in-person recommendations or assistance might reduce the experience for some users.
- **Initial Setup Cost**
 - Hosting, development tools, and database setup may incur a small cost initially if deployed on a live server.
- **Maintenance Needed**
 - Regular updates and database backups are necessary to ensure smooth and secure operation.

Conclusion

The Online Bookstore project demonstrates effective use of database management systems in a real-life application. It integrates backend logic, frontend interfaces, and MySQL efficiently while enforcing data consistency and providing a user-friendly experience. This project reinforces practical concepts of DBMS, including DDL, DML, triggers, and constraints.
